L10 ANSWER 2 OF 7 CAPLUS COPYRIGHT 2005 ACS on STN  
AB The influence of the synthetic process on the catalytic properties of titanium silicalite-1 prepared by mineral materials was studied. The ammoxidn. of cyclohexanone was used to characterize the catalytic activity of the TS-1 samples. Adding seeds or promoter and stirring in TS-1 synthetic process affected the catalytic properties greatly; intracryst. diffusion activity was the main factor that reduced the catalytic properties of TS-1 samples. The TS-1 catalytic properties could be improved greatly by pretreating the TS-1 with H2O2 and H2SO4. With adding-seeds in dynamic state smaller crystal size TS-1 sample was obtained, and after pretreatment the cyclohexanone conversion and oxime yield could reach to 97% and 94%, resp.

 AB Title catalysts are prepared by coating supports with sols or gel suspensions containing Si compds., Ti compds., and tetraalkylammonium compds., drying to form gels, steaming under pressure for crystallization of titanosilicates, and calcination. The catalysts are used in epoxidn. of olefins, hydroxylation of phenols, or ammoxidation of ketones by H2O2. A sol containing (EtO)4Si, (EtO)4Ti, and Pr4N+OH- was added to Caribact 30 (silica gel), dried, steamed at 220° for 6 days, and calcined at 550° for 6 h to give a catalyst containing approx. 23 weight% titanosilicate. Allyl methacrylate was epoxidized by H2O2 in MeOH using the catalyst at 60° for 2.5 h to give glycidyl methacrylate with 87% selectivity at 96% conversion.

 AB The process comprises hydrothermally crystallizing a hydroxide- and salt-free aqueous mixture of colloidal SiO2, a Ti compound, and a tetraalkylammonium compound and NH4OH in NH4OH/tetraalkylammonium mol. ratio (3-200):1. The zeolitic titanium silicate has an x-ray diffraction pattern (measured with Cu-K radiation) as presented, and is used as catalysts, adsorbent, and binder-free catalyst in fluidized-bed, moving-bed, and suspension processes, e.g., the ammoxidation of cyclohexanone to cyclohexanoneoxime. The tetraalkylammonium compound is a tetrapropylammonium halide, e.g., Pr4NBr, or Pr4NOH, and the Ti compound is a Ti alkoxide, e.g., Ti(OEt)4, Ti(OPr)4, that is treated with H2O2.
